Advance Control Engine

Although the details of spark advance control are vehicle model and manufacturer-specific, there are generally two classes of correction that are used: fast correction and slow correction. In the fast correction scheme, the spark advance is decreased for the next engine cycle by a fixed amount (e.g., 5 degrees) whenever knock is detected.

The second way to test the vacuum advance does not require a pickup timing light. With the engine off, remove the distributor cap and use a vacuum hand pump to operate the advance mechanism. The diaphragm moves a rod that turns a sliding plate at the base of the distributor, which can be seen with the naked eye.

Symptoms of Vacuum Advance Problems in Classic Cars

Overall timing changes are still possible, depending on the engine design. Aftermarket engine control units allow the tuner to make changes to the timing map. This allows the timing to be advanced or retarded based on various engine applications. A knock sensor may be used by the ignition system to allow for fuel quality variation. Bibliography
