Introduction Restriction enzymes Genetic engineering is possible because of special enzymes that cut DNA. These enzymes are called restriction enzymes or restriction endonucleases. Restriction enzymes are proteins produced by bacteria to prevent or restrict invasion by foreign DNA. They act as DNA scissors,

DNA Scissors: Introduction to Restriction Enzymes Objectives

Introduction. Restriction enzymes are also called 'molecular scissors' as they cleave DNA at or near specific recognition sequences known as restriction sites. These enzymes make one incision on each of the two strands of DNA and are also called restriction endonucleases. 4, 5. Viruses infect the host cells by injecting their DNA into the ...

Restriction enzymes don't just cut DNA randomly - that would lead to the destruction of the bacterium's own DNA. (That's a bad thing!) Restriction enzymes recognize specific segments of bases called restriction sites. Each different restriction enzyme (and there are hundreds, made by different species of bacteria) has its own particular ...

Scientists use restriction enzymes to cut DNA into smaller pieces so they can analyze and manipulate DNA more easily. Each restriction enzyme recognizes and can attach to a certain sequence on DNA called a restriction site. You can think of restriction enzymes as little molecular scissors that slide along the DNA and cut the sugar-phosphate [...]
